PORTFOLIO SOLUTION PREVIEW

Freight Forwarding & Logistics Management System

Connecting Logistics Operations, Job Costing & Finance in One Workflow

Operations dashboard with the action queue and key figures. Demo data.

Fullstack Developer

5+ Years of Software Development Experience

Shipment data is split across five places. One job number should hold it together.

Shipment data lives in Excel files and chat	Each job is one record with its parties, route, vessel, containers, milestones, and documents.
Job status is hard to follow	Milestones are tracked per job. A public tracking page shows progress through a link, without any prices.
Operating costs are not consolidated	Selling and buying lines sit on the same job, with vendor, currency, and gross margin per job.
Shipping documents are scattered	House and master B/L, shipping instruction, arrival notice, and delivery order are generated from job data.
Invoices are prepared by hand	Invoices start from the job, with PPN 11%. Partial payments, receipts, and journal entries are recorded in the same system.

One job number connects order intake to invoice.

01

Order Intake

A quotation is converted into a job.

Quotations tracked by status (Draft, Sent, Accepted, Rejected). Conversion is logged in the audit trail.

Available

02

Job Order

One job number per shipment, set by mode and direction.

Example: JOB/SEA-EXP/2026/09/0001. Customer, route, commodity, and parties on one form.

Available

03

Shipment Operations

Booking, containers, milestones, and status changes.

Carrier booking with CY, SI, and VGM dates. Containers with seal and type. Planned versus actual milestones.

Available

04

Documents

Shipping documents generated from job data.

House and master B/L, shipping instruction, arrival notice, delivery order. The B/L endpoint returns a PDF.

Available

05

Job Costing

Selling and buying lines, with the vendor on each cost line.

Gross profit and margin calculated per job, in USD and IDR lines.

Available

06

Invoice

AR invoice created from the job, then receipts and journal entries.

AP vendor bill for the same job is listed on the job page.

Available

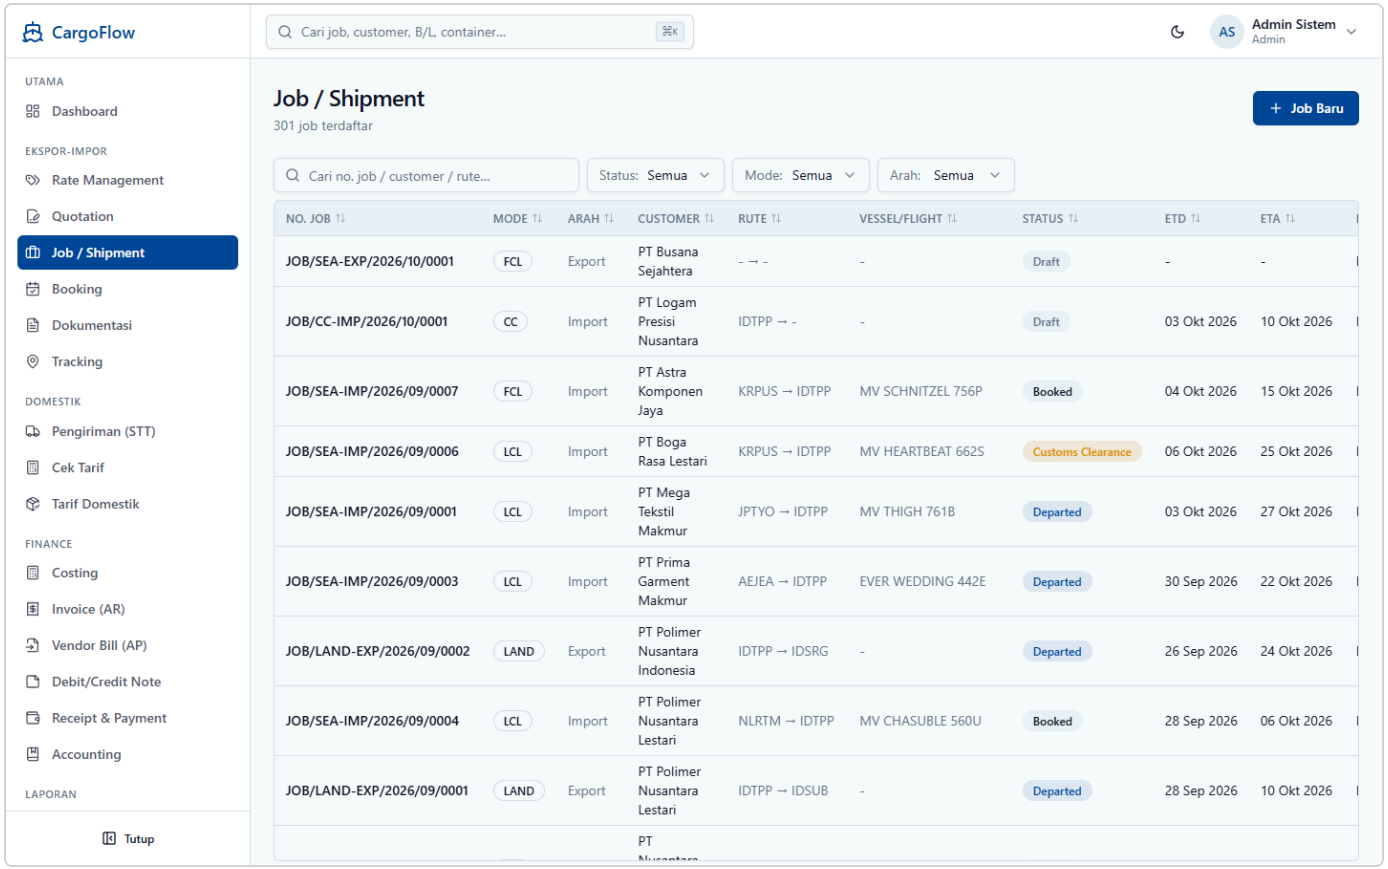

ONE JOB NUMBER

JOB/SEA-EXP/2026/09/0001

Sample sea export, Departed. It has a confirmed booking, two containers, five document types, selling and buying lines, one AR invoice, and one AP bill, all under this number.

Status reflects what was checked in the running application with demo data. Not yet built and shown as proposed work: carrier schedule feed, accounting software sync, and a customer login portal.

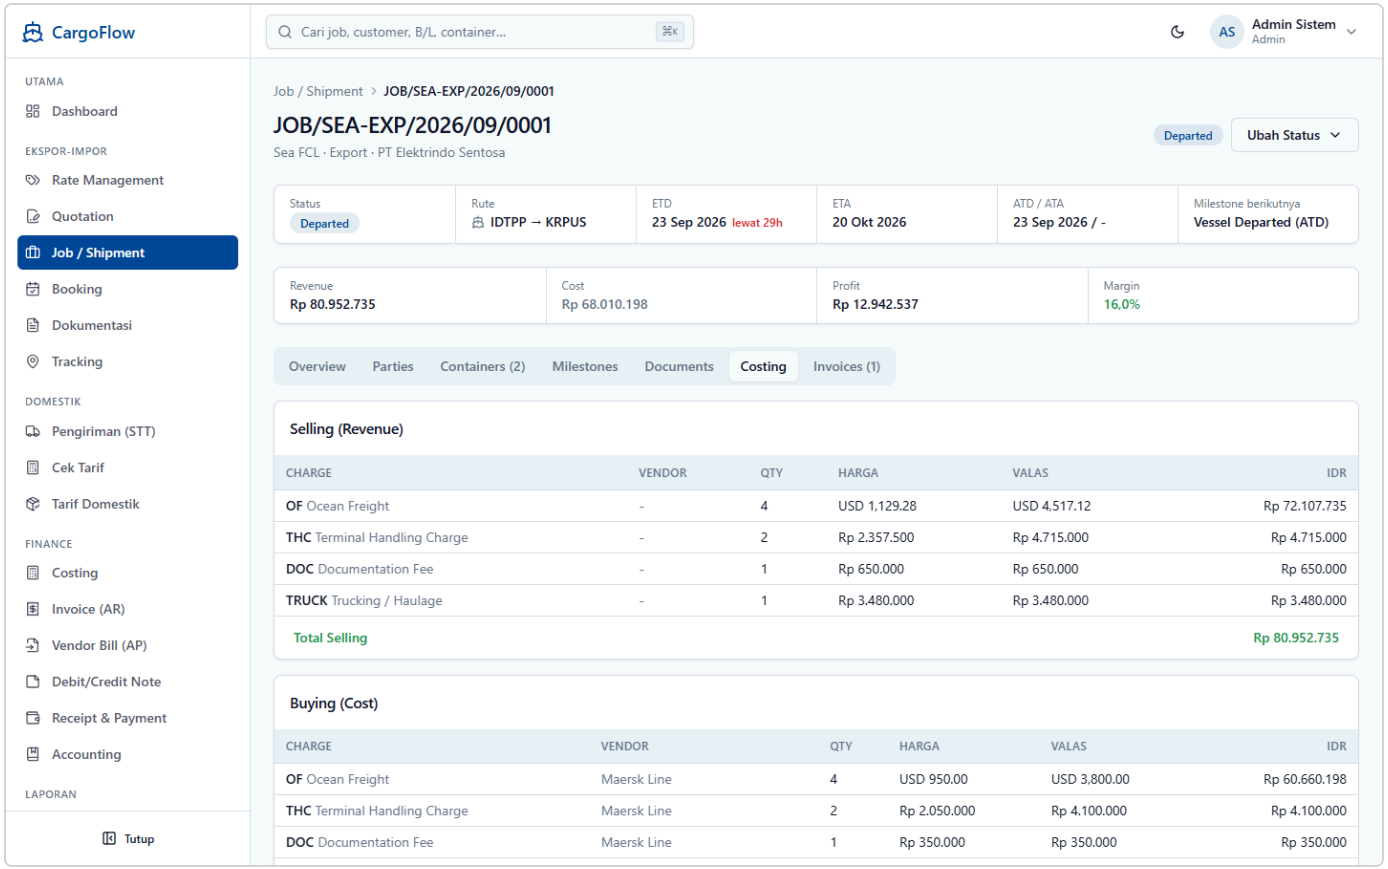

Sea, air, land, and customs jobs live in one record.

Job list with 301 demo jobs. Filters by status, mode, and direction.

- **Modes:** FCL, LCL, air, land, and customs clearance (CC) on the same list.
- **Per job:** origin and destination, vessel or flight, ETD and ETA, and status.
- **Shipment detail:** carrier booking, containers with seal and type, and planned versus actual milestones.
- **Domestic:** its own module for domestic consignment notes (STT), with chargeable weight from the weight rules and rates per kg by route and mode.
- **Tracking:** a public page per job, showing progress without prices.

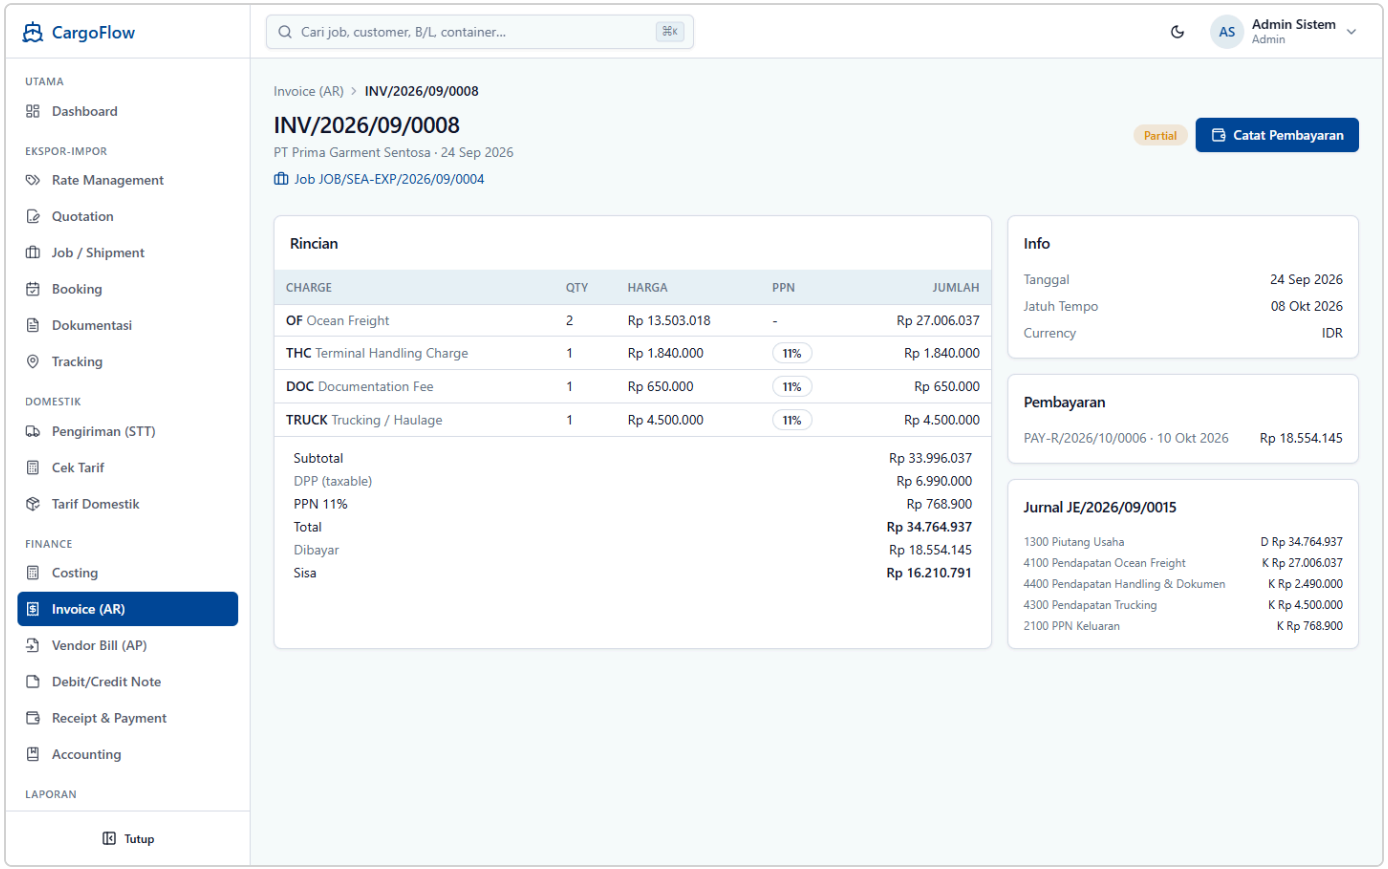

Revenue and cost sit on the same job, line by line.

Costing tab of a sample job: selling lines and buying lines with vendors, in USD and IDR.

- **Selling lines:** charge code, quantity, rate, and IDR amount.
- **Buying lines:** the vendor for each charge, so every cost traces to a payee.
- **Margin per job:** the sample job has revenue of Rp 80.952.735, cost of Rp 68.010.198, and a margin of 16,0%.
- **One set of figures:** the costing list and the management reports use the same numbers. Across 301 demo jobs, the average margin is 13,9%.
- **Profitability by mode:** sea FCL 13,0%, air 14,3%, sea LCL 17,1%, land 13,3%, and customs clearance 27,1% (demo data).

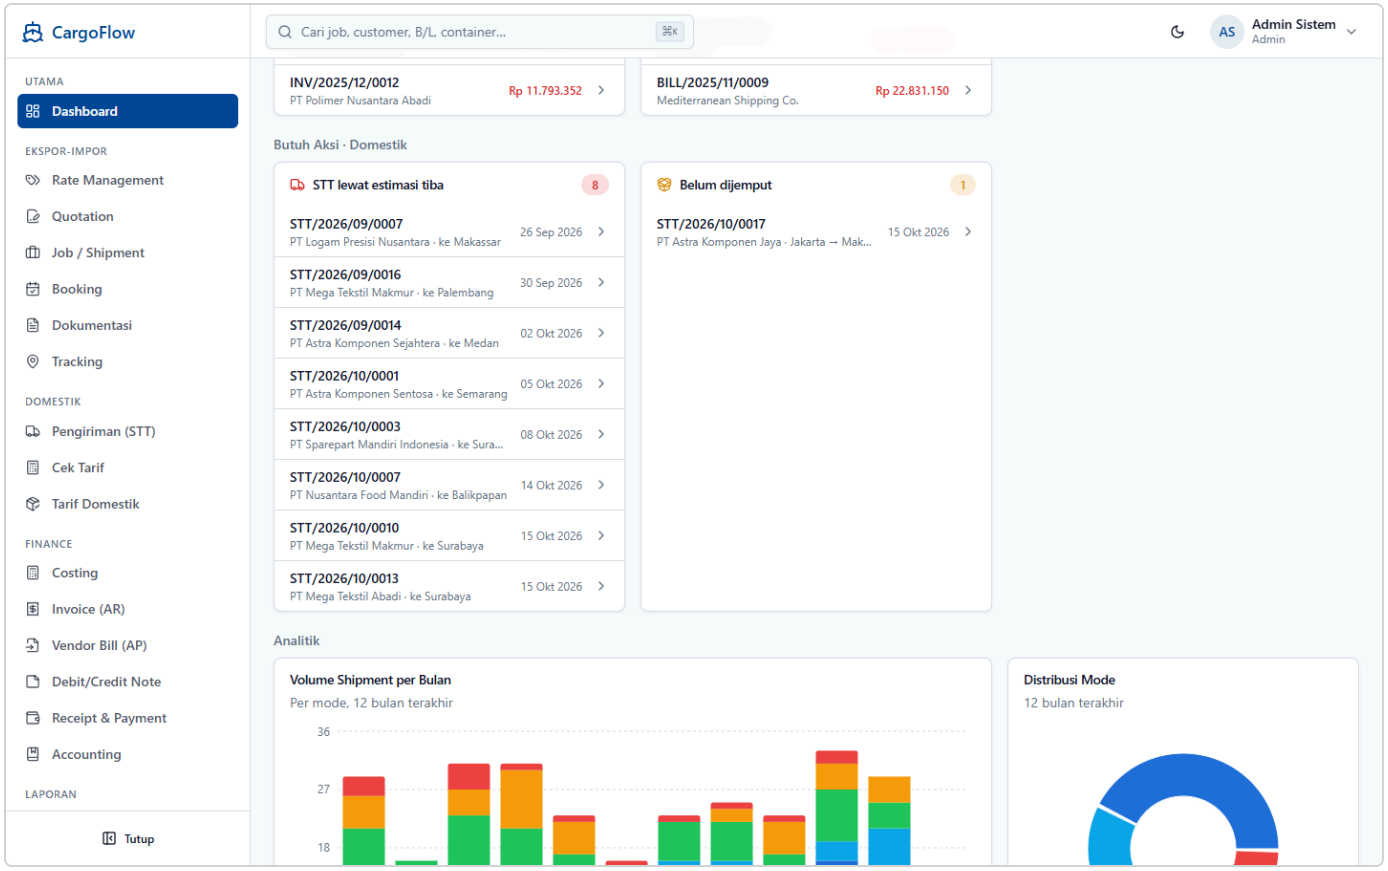

Invoices start from the job, and payments post to the ledger.

Partially paid invoice: charges, PPN 11%, the receipt that reduces the balance, and the journal entry it creates.

- **From the job:** invoice lines come from the job's charges, with PPN 11% and the taxable base (DPP) shown.
- **Payments:** each receipt reduces the outstanding balance and is posted to the journal.
- **Receivables and payables:** AR aging by customer and AP aging by vendor. Vendor bills show PPh 23 withheld.
- **Trial balance:** total debit equals total credit. Demo data: Rp 25.879.741.355 on each side.
- **Access:** accounting is limited to the finance role. Sales users are redirected away from it.

What needs action today, and where the money stands.

Analytics section: monthly volume by mode, revenue against cost and profit, and top customers. Demo data.

- **Action queue:** jobs departing within three days, overdue receivables, payables due within seven days, and domestic shipments past their estimated arrival.
- **Key figures:** active shipments, monthly revenue and gross profit, outstanding invoices, overdue AR, and open quotations.
- **Reports:** profitability by mode, shipments by status, sales by person in charge, and AR and AP aging.
- **Export:** reports download to Excel.

What is ready today, and what needs a decision.

CLIENT REQUIREMENT	EXISTING APPLICATION CAPABILITY	PROPOSED CUSTOMIZATION	STATUS
One job number across order, operations, documents, costing, and invoice	Checked on one sample job: booking, containers, documents, costing, AR invoice, and AP bill	Confirm the client's job numbering format and sequence	Available
Sea, air, land, and customs jobs with milestones	FCL, LCL, air, land, and CC jobs with planned and actual milestones	Map the client's milestone names and status sequence	Requires Verification
Domestic container movements	Domestic container jobs exist in the job module. Domestic parcels (STT) run in their own module.	Agree how domestic container jobs are labeled, priced, and reported	Partially Available
Costing per shipment with margin	Selling and buying per job, gross margin, and multi-currency lines	Load the client's charge codes and vendor list	Available
Invoice readiness check before billing	Invoice created from the job. The job page shows the AR invoice and AP bill.	Define a readiness checklist, such as B/L issued and costing complete	Requires Development
Shipping documents in the client's format	Five sea and three air document types generated as PDF	Adjust layout and fields to the client's templates	Requires Development
Keep the accounting software the client already uses	Built-in general ledger, trial balance, and balance sheet	Decide between the in-app ledger and a sync with the current software	Requires Verification
Migrate existing Excel data	No import tool found in the application	Import with column mapping, validation, and a preview before saving	Requires Development

A structured path from requirements to handover.

1

Requirement Discovery

Review the current Excel files, chats, and documents. List every data field and approval step.

2

Workflow Mapping

Map each job from order to invoice against the one-job-number model.

3

Gap Analysis

Compare the mapped workflow with the status table, and agree on what to build.

4

Customization & Development

Build the agreed changes in short iterations, with a working demo at each step.

5

Testing & User Acceptance

Run the client's real scenarios with their own staff, starting with test data.

6

Deployment & Handover

Deploy, import the existing data, train users, and hand over the documentation.

Let's discuss how this system can be adapted to your logistics operations.

A live demo can be scheduled over **Google Meet**.
